DETAILED ACTION

Allowable Subject Matter

1. The following is an examiner's statement of reasons for allowance:

The invention is directed to a method and system for de-screening an image signal utilizing a bank of filters to provide several increasingly blurred versions of the original image signal. Claims 1, 11, and 17 identify the uniquely distinct features of wherein operation (c) comprises the operations of: (1) receiving, via a contrast module, a filter output signal from one of the filters having larger filter spans, and producing a contrast signal; (2) receiving, via a screen estimate module, the image signal and producing an estimated frequency signal and a estimated frequency and magnitude signal; and (3) receiving, via a pixel control module, the contrast signal from the contrast module and the estimated frequency and magnitude signal from the screen estimate module, and producing the first control signal, the first control signal including information regarding which of the filter output signals are to be blended and the proportion of blending. The closest prior arts, Fan et al, US 6,839,152 in view of Cheung et al, US 6,222,945 teaches the method for de-screening an image signal and selecting a pair of filters from a bank of filters for filtering the image signal.

The prior arts, Fan et al, US 6,839,152 and Cheung et al, US 6,222,945 disclose blending the output from the selected pair of filters but does not disclose receiving, via a pixel control module, the contrast signal from the contrast module and the estimated frequency and magnitude signal from the screen estimate module, and producing the

first control signal, the first control signal including information regarding which of the filter output signals are to be blended and the proportion of blending.

The meaning of the sentences wherein operation (c) comprises the operations of: (1) receiving, via a contrast module, a filter output signal from one of the filters having larger filter spans, and producing a contrast signal; (2) receiving, via a screen estimate module, the image signal and producing an estimated frequency signal and a estimated frequency and magnitude signal; and (3) receiving, via a pixel control module, the contrast signal from the contrast module and the estimated frequency and magnitude signal from the screen estimate module, and producing the first control signal, the first control signal including information regarding which of the filter output signals are to be blended and the proportion of blending is defined in applicant's drawings and specification.

2. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
